

PS SERIES 28VDC Ground Power Units

- The units are smaller and lighter, making handling easier
- Power from 50 to 6,000 amps
- Units are highly efficient >95%
- We offer a comprehensive range of starter units, continuous power units and combination units
- Our units can come with batteries as an option to improve flexibility of use
- Our units are priced with trolleys, covers and cabling making them very price competitive
- The units are IP54 (with cover) and therefore suitable for use indoors and outdoors, operating in temperatures of -20c to 60c
- Our units also come with short lead times, most units are ex stock
- We boast a wide range of installations suitable for all aircraft
- We are true manufacture, so can produce any bespoke unit to your specification

The PS series of 28vDC Ground Power Units utilise the latest in power technology to provide aircraft with 28vDC power in a flexible and cost effective way. They can be used in workshops, aircraft maintenance hangars and aprons where low noise, ease of use and small sizes are demanded. The units have been designed by people who use them day in day out, and we've learned from that experience in the features included and the ways in which operators interact with the unit.

The unit come in three types: starter, continuous power and combination units (start + continuous). They small, light, and easily portable and as a result they can be operated by one person and located close to the aircraft.

All units can come with batteries, reducing the need for you to find a source of electricity to connect to. They come with a heavy duty rubberised output plug as standard, to provide reliable power and connection for the life of the product.

The unit is suitable for most aircrafts where there is a need for 28vDC power, and our team can advise you of the best units for your particular needs.
